Paper 31 Advanced Practical Skills

May/June 2010

2 hours

Candidates answer on the Question Paper.

Additional Materials: As listed in the Instructions to Supervisors

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name on all the work you hand in.

Give details of the practical session and laboratory where appropriate, in the boxes provided.

Write in dark blue or black pen.

You may use a soft pencil for any diagrams, graphs or rough working.

Do not use staples, paper clips, highlighters, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

Answer all questions.

You may lose marks if you do not show your working or if you do not use appropriate units.

Use of a Data Booklet is unnecessary.

Qualitative Analysis Notes are printed on pages 10 and 11.

At the end of the examination, fasten all your work securely together. The number of marks is given in brackets [] at the end of each question or part question.

1 Read through question 1 before starting any practical work.

For Examiner's Use

You are provided with the following reagents.

FA 1, 2.0 mol dm⁻³ sulfuric acid, H₂SO₄

FA 2, aqueous sodium hydroxide, NaOH

The reaction of sulfuric acid with sodium hydroxide is exothermic.

In separate experiments you will add increasing volumes of **FA 2** to a fixed volume of **FA 1**. In each experiment you will measure the maximum temperature rise. As the volume of **FA 2** is increased, this maximum temperature rise will increase and then decrease.

By measuring the maximum temperature rise for different mixtures of the two reagents you are to determine the following.

- the concentration of sodium hydroxide, NaOH, in FA 2
- the enthalpy change when 1 mol of H₂SO₄ is neutralised by NaOH

(a) Method

- Fill the burette with **FA 1**.
- Support the plastic cup in the 250 cm³ beaker.
- Run 10.00 cm³ of **FA 1** from the burette into the plastic cup.
- Measure 10 cm³ of FA 2 in a measuring cylinder.
- Place the thermometer in the **FA 2** in the measuring cylinder and record the steady temperature of the solution.
- Tip the **FA 2** in the measuring cylinder into the plastic cup, stir and record the maximum temperature obtained in the reaction.
- Empty and rinse the plastic cup. Rinse the thermometer. Shake dry the plastic cup.
- Carry out the experiment four more times. Each time use 10.00 cm³ of **FA 1**. Use 20 cm³, 30 cm³, 40 cm³ and 50 cm³ of **FA 2** in these different experiments.

Carry out **two further experiments**.

Choose volumes of **FA 2** which will allow you to investigate more precisely the volume of **FA 2** that produces the highest temperature rise when added to 10.00 cm³ of **FA 1**.

Results

Record your results in an appropriate form showing, for each experiment, the volumes of solution used, temperature measurements and the temperature rise.

[9]

(b) Use the grid below to plot a graph of temperature rise (*y-axis*) against the volume of **FA 2** added (*x-axis*).

Draw a line of best fit through the points where the temperature rise is increasing and another line through the points where the temperature rise is decreasing.

The intersection of these lines represents the temperature rise for the volume of **FA 2** that exactly neutralises the sulfuric acid present in 10.00 cm³ of **FA 1**.

2 Solutions **FA 3**, **FA 4** and **FA 5** each contain a Group 2 halide. Solution **FA 6** contains a potassium salt.

For Examiner's Use

You will carry out tests to deduce the following.

- the anion present in FA 6
- the solution containing the chloride ions
- the solution containing barium ions

At each stage of any test you are to record details of the following.

- colour changes seen
- the formation of any precipitate and the colour of the precipitate

Where gases are released they should be identified by a test, **described in the appropriate** place in your observations.

You should indicate clearly at what stage in a test a change occurs. Marks are **not** given for chemical equations.

No additional tests for ions present should be attempted.

	ny solution is warmed directly with a Bunsen burner a boiling-tube MUST be use see and reuse test-tubes where possible.	∌d.
(a)	Use information from the Qualitative Analysis Notes on page 11 to select a pair reagents that, used together , identify the halide ion present.	of
	The reagents are	
	followed by	[1]
(b)	Use your chosen reagents to carry out tests on FA 3 , FA 4 and FA 5 . Record your results in an appropriate form in the space below.	
		[2]
(c)	From the results of the tests in (b) state which solution contains the chloride ion, Cl^-	•
	Solution contains the chloride ion.	
	Explain the evidence that supports your conclusion.	
		[1]

(d) Carry out the following tests on each of the solutions FA 3, FA 4 and FA 5. Record your observations below.

For Examiner's Use

test		observations	
lesi	FA 3	FA 4	FA 5
To 1 cm depth of solution in a test-tube, add 2 cm depth of aqueous sodium hydroxide.			
To 1 cm depth of solution in a test-tube, add 2 cm depth of aqueous ammonia.			
To 1 cm depth of solution in a test-tube, add 1 cm depth of FA 6 .			

1	רס:
1	- 5
-	

(e)	To 1 cm depth of FA 6 in a test-tube add 1 cm depth of dilute sulfuric acid.
	observation
	[1]

(f) From your observations in (d) and (e) you should be able to identify the anion in FA 6

For Examiner's Use

and	d which of the solutions FA 3 , FA 4 or FA 5 contains barium cations.						
The	he anion present in FA 6 is						
Ba ²	Ba ²⁺ ions are contained in solution						
Exp	plain how your observations support your conclusions for						
(i)	the anion present in FA 6 ,						
(ii)	the solution containing Ba ²⁺ ions.						
		[1]					

Read through the remainder of question 2 before starting further practical work.

Heat a half-full 250 cm³ beaker of water for use as a hot water-bath.

- (g) FA 7, FA 8, FA 9 and FA 10 are organic compounds. Each contains one of the following different functional groups.
 - primary alcohol
 - tertiary alcohol
 - aldehyde
 - ketone

You are to react some of these compounds with some of the following reagents.

- acidified aqueous potassium dichromate(VI)
- 2,4-dinitrophenylhydrazine (2,4-DNPH) reagent
- ammoniacal silver nitrate (Tollens' reagent)

You are provided with the first two reagents. You must prepare the last of these reagents, Tollens' reagent, immediately before use. Follow the instructions in the box below.

To 2 cm depth of aqueous silver nitrate in a boiling-tube add $\frac{1}{2}$ cm depth of aqueous sodium hydroxide. This will produce a brown precipitate of silver(I) oxide. Add aqueous ammonia a little at a time, with continuous shaking, until the brown precipitate **just** dissolves. **Do not add an excess of aqueous ammonia**.

In each of the following tests add a few drops of the reagent to 1 cm depth of FA 7, FA 8, FA 9 and FA 10 in separate test-tubes.

For Examiner's Use

In the tests using acidified potassium dichromate(VI) and Tollens' reagent, if no initial reaction is seen, warm that tube and its contents in your hot water-bath. There is no need to heat any tube to which you have added 2,4-DNPH reagent.

Do **not** heat any tube with a naked flame.

Record your results in the table below.

Do not carry out tests for the shaded boxes.

reagent	observations				
	FA 7	FA 8	FA 9	FA 10	
acidified potassium dichromate(VI)					
2,4-DNPH reagent					
Tollens' reagent
