CANDIDATE NAME		

Paper 3 Advanced Practical Skills 2

9/01/34

May/June 2019

2 hours

Candidates answer on the Question Paper.

Additional Materials:

As listed in the Confidential Instructions

#### **READ THESE INSTRUCTIONS FIRST**

Write your centre number, candidate number and name on all the work you hand in.

Give details of the practical session and laboratory where appropriate, in the boxes provided.

Write in dark blue or black pen.

You may use an HB pencil for any diagrams or graphs.

Do not use staples, paper clips, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

Answer all questions.

Electronic calculators may be used.

You may lose marks if you do not show your working or if you do not use appropriate units.

Use of a Data Booklet is unnecessary.

Qualitative Analysis Notes are printed on pages 10 and 11.

A copy of the Periodic Table is printed on page 12.

At the end of the examination, fasten all your work securely together. The number of marks is given in brackets [ ] at the end of each question or part question.

#### **Quantitative Analysis**

Read through the whole method before starting any practical work. Where appropriate, prepare a table for your results in the space provided.

Show your working and appropriate significant figures in the final answer to **each** step of your calculations.

1 Iron wire contains impurities. You will investigate the percentage by mass of iron in a sample of iron wire.

A sample of iron wire is reacted with an excess of sulfuric acid to produce a solution of iron(II) sulfate.

$$Fe(s) + H_2SO_4(aq) \rightarrow FeSO_4(aq) + H_2(g)$$

You will titrate the solution of iron(II) sulfate with potassium manganate(VII) of known concentration to determine the amount of iron(II) ions present and hence the percentage by mass of iron in the wire. You may assume the impurities do not form any products that react with potassium manganate(VII).

$$5Fe^{2+}(aq) + MnO_4^{-}(aq) + 8H^{+}(aq) \rightarrow 5Fe^{3+}(aq) + Mn^{2+}(aq) + 4H_2O(I)$$

FB 1 is 0.0200 mol dm<sup>-3</sup> potassium manganate(VII), KMnO<sub>4</sub>.

**FB 2** is a solution of FeSO<sub>4</sub> prepared by reacting 6.02g of iron wire with sulfuric acid to make 1 dm<sup>3</sup> of solution.

FB 3 is dilute sulfuric acid, H<sub>2</sub>SO<sub>4</sub>.

### (a) Method

- Fill a burette with **FB 1**.
- Pipette 25.0 cm<sup>3</sup> of FB 2 into a conical flask.
- Use the measuring cylinder to transfer 25 cm<sup>3</sup> of **FB 3** into the conical flask.
- Perform a rough titration and record your burette readings in the space below.

The rough	titre	ic	 $cm^3$
THE TOUGHT	แแบ	13	 UIII .

- Carry out as many accurate titrations as you think necessary to obtain consistent results.
- Make certain that any recorded results show the precision of your practical work.
- Record all of your burette readings and the volume of **FB 1** added in each accurate titration.

Keep FB 3 for use in Question 2.

Results

I II III IV V VI VII

[7]

(b)		om your accurate titration results, obtain a suitable value for the volume of <b>FB 1</b> to be used your calculations. Show clearly how you obtained this value.
		25.0 cm <sup>3</sup> of <b>FB 2</b> required cm <sup>3</sup> of <b>FB 1</b> . [1]
(c)	(i)	Give your answers to (ii), (iii), (iv) and (v) to the appropriate number of significant figures. [1]
	(ii)	Use your answer to <b>(b)</b> to calculate the number of moles of potassium manganate(VII), <b>FB 1</b> , which reacted with $25.0\text{cm}^3$ of <b>FB 2</b> .
		moles of $MnO_4^- = \dots mol$ [1]
	(iii)	Use the information on page 2 to calculate the number of moles of iron(II) ions present in $25.0\text{cm}^3$ of <b>FB 2</b> .
		moles of $Fe^{2+} = \dots mol$ [1]
	(iv)	Calculate the mass of iron present in 25.0 cm <sup>3</sup> of <b>FB 2</b> .
		mass of Fe = g [1]
	(v)	Calculate the percentage by mass of iron in the sample of iron wire.
		percentage by mass of iron in iron wire = % [1]
(d)	co de	student suggested that when a piece of iron wire was dissolved in a known volume and ncentration of sulfuric acid, the number of moles of iron that reacted with the acid could be termined by working out how much acid was left after the reaction. The amount of excess acid uld be determined by titrating the mixture with a known concentration of sodium hydroxide.
	Ex	plain whether the student was correct.
		[1]
		[Total: 14]

2 In Question 1 you used dilute sulfuric acid, FB 3. You will now determine the concentration of FB 3 by measuring the temperature of its reaction with sodium hydroxide.

$$2NaOH(aq) + H_2SO_4(aq) \rightarrow Na_2SO_4(aq) + 2H_2O(I)$$

**FB 4** is 0.90 mol dm<sup>-3</sup> sodium hydroxide, NaOH.

#### (a) Method

- Fill the second burette with FB 4.
- Support the plastic cup in the 250 cm<sup>3</sup> beaker.
- Pipette 10.0 cm<sup>3</sup> of **FB 3** into the plastic cup.
- Place the thermometer into the FB 3. Tilt the cup so that the bulb of the thermometer is surrounded by solution. Record the temperature in the table below. This is the temperature of the solution before any FB 4 has been added.
- Add 5.00 cm<sup>3</sup> of **FB 4** from the burette to the **FB 3** in the plastic cup. Stir the mixture and record the temperature reached. Record the volume of **FB 4** added.
- Add a second 5.00 cm³ portion of **FB 4** to the plastic cup, stir the mixture and record the temperature reached. Record the total volume of **FB 4** added.
- Continue adding 5.00 cm³ portions of **FB 4** until 40.00 cm³ have been added. After each addition, stir and record the temperature reached and total volume of **FB 4** added.

#### Results

total volume of <b>FB 4</b> added/cm <sup>3</sup>	temperature of solution/°C

[3]

**(b)** Plot a graph of temperature of solution on the *y*-axis against total volume of **FB 4** added on the *x*-axis. Select a scale on the *y*-axis to include a temperature of 2.0 °C above your maximum thermometer reading. Label any points you consider to be anomalous. You will use the graph to find the volume of **FB 4** needed to neutralise 10.0 cm<sup>3</sup> of **FB 3**.

Draw two lines of best fit through the points on your graph, the first for the increase in temperature and the second for the decrease in temperature of the mixtures. Extrapolate the two lines so they intersect and hence determine the volume of **FB 4** required to neutralise 10.0 cm<sup>3</sup> of **FB 3**.

volume of <b>FB 4</b> =	 cm <sup>3</sup>
	[4]

(c) (i) Use your answer to (b) to calculate the number of moles of sodium hydroxide required to neutralise 10.0 cm <sup>3</sup> of FB 3.
moles of NaOH = mol [7]  (ii) Calculate the number of moles of sulfuric acid present in 10.0 cm³ of FB 3.
moles of $\rm H_2SO_4$ =
concentration of $H_2SO_4$ in <b>FB 3</b> = moldming.
(d) Explain how you would use the data obtained in <b>Question 2</b> to calculate the enthalpy chang of neutralisation of the sulfuric acid. You do not need to carry out the calculation.
[3

#### **Qualitative Analysis**

Where reagents are selected for use in a test, the **name** or **correct formula** of the element or compound must be given.

At each stage of any test you are to record details of the following:

- colour changes seen;
- the formation of any precipitate and its solubility in an excess of the reagent added;
- the formation of any gas and its identification by a suitable test.

You should indicate clearly at what stage in a test a change occurs.

If any solution is warmed, a **boiling tube** must be used.

Rinse and reuse test-tubes and boiling tubes where possible.

No additional tests for ions present should be attempted.

3 (a) FB 5 is a solution of a sodium salt of an organic acid.

**FB 6** and **FB 7** each contain one cation and one anion from those listed in the Qualitative Analysis Notes.

Carry out the following tests and record your observations.
Use a separate 1 cm depth of each solution in a test-tube for each test.

40.04		observations	
test	FB 5	FB 6	FB 7
Add 2 or 3 drops of acidified potassium manganate(VII).			
If there is no visible change, pour into a boiling tube and warm gently.			
Add a 1 cm depth of dilute nitric acid, then			
add 2 or 3 drops of aqueous silver nitrate.			
Add a 1 cm depth of dilute hydrochloric acid, then			
add a 1 cm depth of aqueous barium nitrate or aqueous barium chloride.			
Add a 1 cm depth of <b>FB 5</b> and leave to stand for a few minutes.			

Record in a suitable form below the reagents you use and your observations.
[
i) Use your observations to identify as many ions as possible. Give the formula of the ion present. Write 'unknown' if you were unable to identify an ion.
FB 6 FB 7
FB 6 FB 7
cation
cation anion  Write an ionic equation for any precipitation reaction observed involving FB 7. Include
cation anion
