Paper 4 Further Problem-solving and Programming Skills

May/June 2021

MARK SCHEME

Maximum Mark: 75

Published

This mark scheme is published as an aid to teachers and candidates, to indicate the requirements of the examination. It shows the basis on which Examiners were instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began, which would have considered the acceptability of alternative answers.

Mark schemes should be read in conjunction with the question paper and the Principal Examiner Report for Teachers.

Cambridge International will not enter into discussions about these mark schemes.

Cambridge International is publishing the mark schemes for the May/June 2021 series for most Cambridge IGCSE™, Cambridge International A and AS Level components and some Cambridge O Level components.

This document consists of **20** printed pages.

PUBLISHED**Generic Marking Principles**

These general marking principles must be applied by all examiners when marking candidate answers. They should be applied alongside the specific content of the mark scheme or generic level descriptors for a question. Each question paper and mark scheme will also comply with these marking principles.

GENERIC MARKING PRINCIPLE 1:

Marks must be awarded in line with:

- the specific content of the mark scheme or the generic level descriptors for the question
- the specific skills defined in the mark scheme or in the generic level descriptors for the question
- the standard of response required by a candidate as exemplified by the standardisation scripts.

GENERIC MARKING PRINCIPLE 2:

Marks awarded are always **whole marks** (not half marks, or other fractions).

GENERIC MARKING PRINCIPLE 3:

Marks must be awarded **positively**:

- marks are awarded for correct/valid answers, as defined in the mark scheme. However, credit is given for valid answers which go beyond the scope of the syllabus and mark scheme, referring to your Team Leader as appropriate
- marks are awarded when candidates clearly demonstrate what they know and can do
- marks are not deducted for errors
- marks are not deducted for omissions
- answers should only be judged on the quality of spelling, punctuation and grammar when these features are specifically assessed by the question as indicated by the mark scheme. The meaning, however, should be unambiguous.

GENERIC MARKING PRINCIPLE 4:

Rules must be applied consistently, e.g. in situations where candidates have not followed instructions or in the application of generic level descriptors.

GENERIC MARKING PRINCIPLE 5:

Marks should be awarded using the full range of marks defined in the mark scheme for the question (however; the use of the full mark range may be limited according to the quality of the candidate responses seen).

GENERIC MARKING PRINCIPLE 6:

Marks awarded are based solely on the requirements as defined in the mark scheme. Marks should not be awarded with grade thresholds or grade descriptors in mind.

Question	Answer	Marks
1(a)	<p>1 mark for each completed space - accept any equivalent statements</p> <pre> graph TD Start(()) --> TMI((Total the money inserted)) TMI -- "Insert Coin" --> TMI TMI -- "cancel" --> RM((Return money)) TMI -- "Enter code" --> CCV((Check code valid)) CCV -- "Code re-entered" --> CCV CCV -- "cancel" --> RM CCV -- "Valid code" --> CTI((Check total inserted)) CTI -- "Insufficient money" --> TMI CTI -- "Sufficient money" --> DI((Dispense Item)) </pre>	5

Question	Answer	Marks
1(b)(i)	<p>1 mark per bullet point to max 4</p> <ul style="list-style-type: none"> • Class declaration and end • Private <code>Items</code> declared as array with 4 elements of type <code>foodItem</code> • Private <code>moneyIn</code> declared as real and initialised to 0 in constructor • Constructor heading taking 4 parameters and end ... • ... assigning parameters to all 4 array values <p>Example code:</p> <p>VB.NET</p> <pre>Public Class vendingMachine Private items(3) As foodItem Private moneyIn As Single Public Sub New(item1, item2, item3, item4) items(0) = item1 items(1) = item2 items(2) = item3 items(3) = item4 moneyIn = 0 End Sub End Class</pre> <p>Python</p> <pre>class vendingMachine: #private items(4) of type foodItem #private moneyIn of type Real def __init__(self, item1, item2, item3, item4): self.__items = [] self.__items.append(item1) self.__items.append(item2) self.__items.append(item3) self.__items.append(item4) self.__moneyIn = 0</pre>	4
