Paper 4 Practical

October/November 2022

MARK SCHEME

Maximum Mark: 75

Published

This mark scheme is published as an aid to teachers and candidates, to indicate the requirements of the examination. It shows the basis on which Examiners were instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began, which would have considered the acceptability of alternative answers.

Mark schemes should be read in conjunction with the question paper and the Principal Examiner Report for Teachers.

Cambridge International will not enter into discussions about these mark schemes.

Cambridge International is publishing the mark schemes for the October/November 2022 series for most Cambridge IGCSE™, Cambridge International A and AS Level components and some Cambridge O Level components.

This document consists of **23** printed pages.

Generic Marking Principles

These general marking principles must be applied by all examiners when marking candidate answers. They should be applied alongside the specific content of the mark scheme or generic level descriptors for a question. Each question paper and mark scheme will also comply with these marking principles.

GENERIC MARKING PRINCIPLE 1:

Marks must be awarded in line with:

- the specific content of the mark scheme or the generic level descriptors for the question
- the specific skills defined in the mark scheme or in the generic level descriptors for the question
- the standard of response required by a candidate as exemplified by the standardisation scripts.

GENERIC MARKING PRINCIPLE 2:

Marks awarded are always **whole marks** (not half marks, or other fractions).

GENERIC MARKING PRINCIPLE 3:

Marks must be awarded **positively**:

- marks are awarded for correct/valid answers, as defined in the mark scheme. However, credit is given for valid answers which go beyond the scope of the syllabus and mark scheme, referring to your Team Leader as appropriate
- marks are awarded when candidates clearly demonstrate what they know and can do
- marks are not deducted for errors
- marks are not deducted for omissions
- answers should only be judged on the quality of spelling, punctuation and grammar when these features are specifically assessed by the question as indicated by the mark scheme. The meaning, however, should be unambiguous.

GENERIC MARKING PRINCIPLE 4:

Rules must be applied consistently, e.g. in situations where candidates have not followed instructions or in the application of generic level descriptors.

GENERIC MARKING PRINCIPLE 5:

Marks should be awarded using the full range of marks defined in the mark scheme for the question (however; the use of the full mark range may be limited according to the quality of the candidate responses seen).

GENERIC MARKING PRINCIPLE 6:

Marks awarded are based solely on the requirements as defined in the mark scheme. Marks should not be awarded with grade thresholds or grade descriptors in mind.

Question	Answer	Marks
1(a)	<p>1 mark per point:</p> <ul style="list-style-type: none"> • (global) 1D (Integer) array <code>DataArray</code> • 100 elements <p>Example program code:</p> <p>Python <code>DataArray = [0 for I in range (100)]</code></p> <p>Java <code>public static Integer[] dataArray = new Integer[100];</code></p> <p>VB.NET <code>Dim dataArray(99) As Integer</code></p>	2
1(b)	<p>1 mark per point:</p> <ul style="list-style-type: none"> • Procedure <code>ReadFile()</code> header (and end where appropriate) • opening file <code>IntegerData.txt</code> (for read) • looping through the 100 elements // looping to end of file • reading each (and all) value from file and storing in array • closing file (in appropriate place) <p>1 mark per point:</p> <ul style="list-style-type: none"> • Exception Handling (for opening the file, or for reading values from the file)... • ...with appropriate catch and output messages <p>Example program code:</p> <p>Python <code>def ReadFile():</code> <code> global dataArray</code> <code> try:</code> <code> textfile = "IntegerData.txt"</code> <code> file = open(textfile, 'r')</code> <code> for X in range(0, 100):</code> <code> dataArray[X] = file.readline()</code> <code> dataArray[X].rstrip('\n')</code> <code> dataArray[X] = int(dataarray[X])</code> <code> file.close()</code> <code> except IOError:</code> <code> print("Count not find file")</code></p>	6

Question	Answer	Marks
1(b)	<p>Java</p> <pre>public static void ReadFile(){ String Filename = "IntegerData.txt"; try{ FileReader F = new FileReader(Filename); BufferedReader Reader = new BufferedReader(F); for(Integer X = 0; X < 100; X++){ dataArray[X] = Integer.parseInt(Reader.readLine()); } Reader.close(); } catch(FileNotFoundException ex){ System.out.println("No file found"); } catch(IOException ex){ System.out.println("No file found"); } } </pre> <p>VB.NET</p> <pre>Sub ReadFile() try Dim TextFile As String = "IntegerData.txt" Dim FileReader As New System.IO.StreamReader(TextFile) For X = 0 To 99 dataArray(X) = FileReader.ReadLine() Next FileReader.Close() Catch ex As Exception Console.WriteLine("Invalid file") End Try End Sub </pre>	
1(c)	<p>1 mark per point:</p> <ul style="list-style-type: none"> • Function FindValues() (and end where appropriate) and input of data to search for in the array • ...validation/casting(/storing as) of input as integer • ...validation of input between 1 and 100 (inclusive) • looping through all 100 array elements... • ...comparing input to each array element... • ...initialising counter to 0 and then adding 1 each time it is found... • Returning the total 	7

Question	Answer	Marks
1(c)	<p>Example program code:</p> <p>Python</p> <pre>def FindValues(): global DataArray DataToFind = -1 while(DataToFind < 1 or DataToFind > 100): DataToFind = int(input("Enter a number between 1 and 100")) Total = 0 for X in range(0, 99): if DataArray[X] == DataToFind: Total = Total + 1 return Total</pre> <p>VB.NET</p> <pre>Function FindValues() Dim DataToFind As Integer Do Console.WriteLine("Enter a number between 1 and 100") DataToFind = Console.ReadLine() Loop Until (DataToFind >= 1 And DataToFind <= 100) Dim Total As Integer = 0 For X = 0 To 99 If DataArray(X) = DataToFind Then Total = Total + 1 End If Next Return Total End Function</pre> <p>Java</p> <pre>public static Integer FindValues(){ Integer DataToFind = -1; while(DataToFind < 1 DataToFind > 100){ System.out.println("Enter a number between 1 and 100"); Scanner in = new Scanner(System.in); DataToFind = in.nextInt(); } Integer Total = 0; for(Integer X = 0; X < 100; X++){ if(DataArray[X] == DataToFind){ Total = Total + 1; } } return Total; }</pre>	

Question	Answer	Marks
1(d)(i)	<p>1 mark per point:</p> <ul style="list-style-type: none"> • Calling <code>ReadFile()</code> and then <code>FindValues()</code> (in the main program) • storing/using return value from <code>FindValues()</code> ... • ...outputting return value with appropriate message <p>Example program code:</p> <p>Python</p> <pre>ReadFile() print("The number appears " + str(FindValues()) + " times")</pre> <p>Java</p> <pre>public static void main(String[] args){ ReadFile(); Integer ReturnValue = FindValues(); System.out.println("The number was found " + ReturnValue + " times"); }</pre> <p>VB.NET</p> <pre>Sub Main() ReadFile() Dim ReturnValue As Integer = FindValues() Console.WriteLine("The number was found " & ReturnValue & " times") End Sub</pre>	3
1(d)(ii)	<p>Screenshot showing 61 input and 2 output, e.g.</p>  <p>The screenshot shows a terminal window with a black background and white text. The first line is a prompt: "Enter a number between 1 and 100". The second line shows the user input "61". The third line shows the program output: "The number was found 2 times".</p>	1

Question	Answer	Marks
1(e)	<p>1 mark per point:</p> <ul style="list-style-type: none"> • procedure declaration (and end where appropriate) and outputting array contents at end of procedure and calling procedure from main program • correct outer loop ... • ... correct inner loop ... • ... swapping all elements if in incorrect order <p>Example program code:</p> <p>Python</p> <pre>def BubbleSort(): global DataArray N = 100 for I in range(N-1): for J in range(0, N-I-1): if DataArray[J] > DataArray[J+1]: DataArray[J], DataArray[J+1] = DataArray[J+1], DataArray[J] #main ReadFile() print("The number appears " + str(FindValues()) + " times") BubbleSort() print(DataArray)</pre> <p>Java</p> <pre>public static void BubbleSort(){ Integer Temp = 0; for(Integer I = 0; I < 100-1; I++){ for(Integer J = 0; J < 100-I-1; J++){ if(DataArray[J] > DataArray[J+1]){ Temp = DataArray[J]; DataArray[J] = DataArray[J+1]; DataArray[J+1] = Temp; } } } for(Integer X = 0; X < 100; X++){ System.out.println(DataArray[X]); } } public static void main(String[] args){ ReadFile(); Integer ReturnValue = FindValues(); System.out.println("The number was found " + ReturnValue + " times"); BubbleSort(); }</pre>	4

Question	Answer	Marks
