

Cambridge IGCSE[™]

CANDIDATE NAME		
CENTRE NUMBER		CANDIDATE NUMBER
CHEMISTRY 0620/63		
Paper 6 Alternative to Practical		October/November 2020

1 hour

You must answer on the question paper.

No additional materials are needed.

INSTRUCTIONS

- Answer **all** questions.
- Use a black or dark blue pen. You may use an HB pencil for any diagrams or graphs.
- Write your name, centre number and candidate number in the boxes at the top of the page.
- Write your answer to each question in the space provided.
- Do **not** use an erasable pen or correction fluid.
- Do **not** write on any bar codes.
- You may use a calculator.
- You should show all your working and use appropriate units.

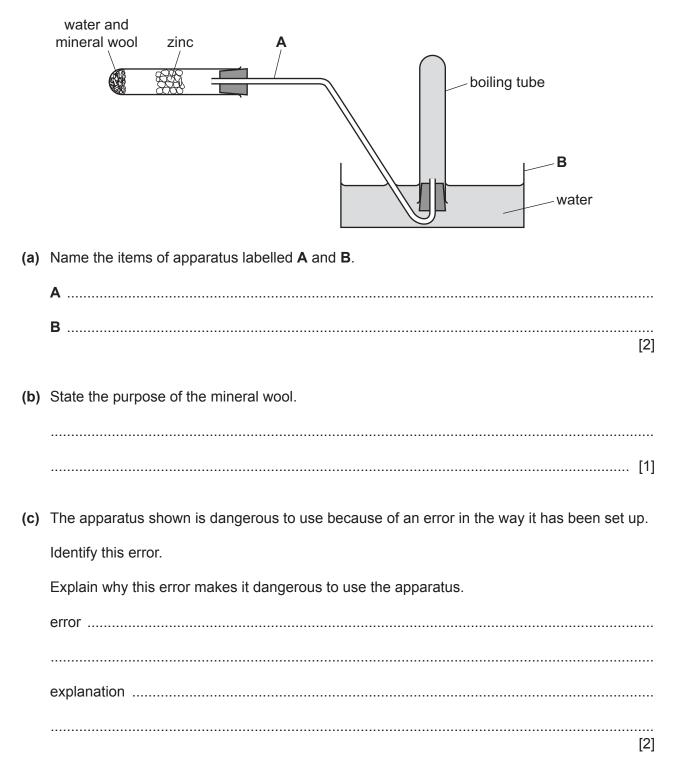

INFORMATION

- The total mark for this paper is 40.
- The number of marks for each question or part question is shown in brackets [].

This document has **12** pages. Blank pages are indicated.

1 Hot zinc reacts with steam to make zinc oxide and hydrogen gas.

A student wanted to use the apparatus shown to react zinc with steam and to collect the hydrogen.

- (d) Add two arrows to the diagram to show the two places where the apparatus should be heated once the error in (c) has been corrected. [1]

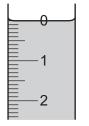

[Total: 8]

2 A student investigated the reaction between dilute ethanoic acid and two different solutions of sodium hydroxide labelled solution **A** and solution **B**.

Two experiments were done.

- (a) Experiment 1
 - A burette was rinsed with solution **A**.
 - The burette was filled with solution **A**. Some of solution **A** was run out of the burette so that the level of solution **A** was on the burette scale.
 - Using a measuring cylinder, 25 cm³ of dilute ethanoic acid was poured into a conical flask.
 - Five drops of thymolphthalein indicator were added to the conical flask.
 - Solution **A** was added slowly from the burette to the conical flask, while the flask was swirled, until the solution just changed colour.

Use the burette diagrams to complete the table for Experiment 1.

initial reading

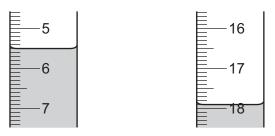

final reading

	Experiment 1
final burette reading/cm ³	
initial burette reading/cm ³	
volume of solution A added/cm ³	

Experiment 2

- The conical flask was emptied and rinsed with distilled water.
- The burette was emptied and rinsed with distilled water.
- The burette was rinsed with solution **B**.
- The burette was filled with solution **B**. Some of solution **B** was run out of the burette so that the level of solution **B** was on the burette scale.
- Using a measuring cylinder, 25 cm³ of dilute ethanoic acid was poured into a conical flask.
- Five drops of thymolphthalein indicator were added to the conical flask.
- Solution **B** was added slowly from the burette to the conical flask, while the flask was swirled, until the solution just changed colour.

Use the burette diagrams to complete the table for Experiment 2.

initial reading

final reading

	Experiment 2
final burette reading/cm ³	
initial burette reading/cm ³	
volume of solution B added/cm ³	

[4]

(b) Explain why universal indicator is not a suitable indicator to use in this titration.

......[1]

- (c) (i) State which solution of sodium hydroxide, solution A or solution B, was the more concentrated. Explain your answer.
 - -----

......[1]

(ii) State how many times more concentrated this solution of sodium hydroxide was than the other solution of sodium hydroxide.

(d)		ermine the volume of solution B that would be required if Experiment 2 was repeated with cm ³ of dilute ethanoic acid.
(e)	Des	scribe how the reliability of the results could be checked.
(f)	A 2	5 cm ³ pipette can be used to measure the volume of a solution.
	(i)	Describe an advantage of using a 25 cm ³ pipette to measure the volume of the dilute ethanoic acid.
1	(ii)	[1] Explain why a 25 cm ³ pipette could not be used to measure the volume of solution A .
(g)	(i)	Explain why the burette was rinsed with distilled water in Experiment 2.
		[1]
	(ii)	[1] Explain why the burette was then rinsed with solution B .
		[1]
(iii)	State the effect that not rinsing the burette with solution B would have on the final burette reading. Explain your answer.
		effect
		explanation

3 Two solids, solid **C** and solid **D**, were analysed. Tests were done on each solid.

tests on solid C

Tests were done and the following observations were made.

tests on solid C	observations	
test 1		
Half of solid C was placed in a test-tube. The solid was heated gently and then strongly.	steam was given off and condensation appeared at the mouth of the test-tube, the remaining solid became black	
The remaining solid C was dissolved in distilled water to produce solution C . The solution was divided into two equal portions in two test-tubes.		
test 2 A few drops of universal indicator solution were added to the first portion of solution C .	the solution became orange	
test 3		
A spatula measure of solid sodium carbonate was added to the second portion of solution C . Any gas produced was tested.	effervescence was seen, the gas turned limewater milky	
(a) Suggest the pH of solution C.		
	pH = [1]	
(b) Identify the gas produced in test 3.		
	[1]	
(c) What conclusions can you make about solid C?		

https://xtremepape.rs/

tests on solid D

Solid **D** was calcium chloride.

Complete the expected observations.

Solid **D** was dissolved in water to form solution **D**. Solution **D** was divided into four approximately equal portions in four test-tubes.

(d) (i)	A few drops of aqueous sodium hydroxide were added to the first portion of solution D .	
	observations[1]	
(ii)	An excess of aqueous sodium hydroxide was added to the mixture from (d)(i).	
	observations[1]	
(e) Aq	ueous ammonia was added dropwise and then in excess to the second portion of solution D .	
ob	servations	
• •	(f) About 1 cm ³ of dilute nitric acid and a few drops of aqueous silver nitrate were added to the third portion of solution D.	
ob	servations[1]	
	out 1cm^3 of dilute nitric acid and a few drops of aqueous barium nitrate were added to the irth portion of solution D .	
ob	servations[1]	
	[Total: 10]	

- **4** A toothpaste contains:
 - sodium fluoride
 - calcium carbonate
 - silica
 - mint flavouring.

Sodium fluoride and the mint flavouring are soluble in water.

Calcium carbonate and silica are insoluble in water.

Calcium carbonate reacts with dilute hydrochloric acid to form the soluble salt calcium chloride.

Plan an investigation to find the percentage by mass of silica in the toothpaste.

In your answer you should include how you will calculate the percentage by mass of silica in the toothpaste.

You have access to normal laboratory apparatus.
