Paper 6 Alternative to Practical

October/November 2021

1 hour

You must answer on the question paper.

No additional materials are needed.

INSTRUCTIONS

- Answer **all** questions.
- Use a black or dark blue pen. You may use an HB pencil for any diagrams or graphs.
- Write your name, centre number and candidate number in the boxes at the top of the page.
- Write your answer to each question in the space provided.
- Do **not** use an erasable pen or correction fluid.
- Do **not** write on any bar codes.
- You may use a calculator.
- You should show all your working and use appropriate units.

INFORMATION

- The total mark for this paper is 40.
- The number of marks for each question or part question is shown in brackets [].

This document has **12** pages. Any blank pages are indicated.

Answer **all** questions in the spaces provided.

- 1 The tissue of a peeled potato tuber is composed of many similar cells. A student investigated the effect of varying concentrations of sucrose solution on some potato tissue.

She was provided with:

- a potato tuber with the outer peel removed
- distilled water labelled **A**
- three sucrose solutions of different concentrations labelled **B**, **C** and **D**.

She cut four strips of tissue from the potato, each measuring 5 mm × 5 mm in cross-section and 80 mm long. This was their length at the start of the investigation.

- (a) (i) Describe in detail how you would cut strips of potato to this size.

.....
.....
.....
.....
.....
..... [3]

The student then labelled four test-tubes **A**, **B**, **C** and **D**. She placed one potato strip in each and then added distilled water to test-tube **A**, and the sucrose solutions **B**, **C** and **D** to test-tubes **B**, **C** and **D**. She made sure that each potato strip was fully covered by solution.

After 30 minutes, she poured away the solutions and prepared to remove the potato strips from the test-tubes to measure them.

- (ii) Describe what she could do to ensure that, after they had been removed from the test-tubes, she knew which potato strip had been in which solution.

.....
..... [1]

The diagram shows the four potato strips after 30 minutes in the solutions.

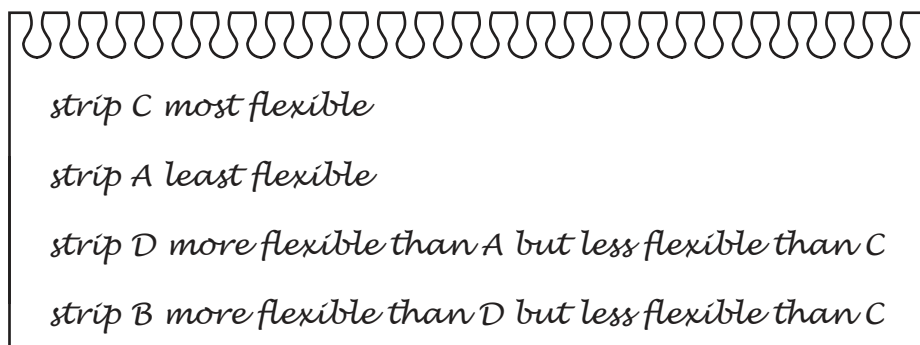

- (iii) Measure the lengths of strips **A**, **B**, **C** and **D**. Record the lengths of each strip at the **start** and **end** of the investigation and calculate the changes in length. Enter your results in the table.

solution	start length /mm	end length /mm	change in length/mm	flexibility of strip
A				
B				
C				
D				

[3]

She also assessed the flexibility of each strip by gently bending them. The more easily the strip bent, the more flexible it was. She recorded her results in her notebook:

- (iv) Arrange the strips in order of decreasing flexibility and use the scale below to record this in the table. Record the most flexible strip as +++++ and the least flexible as +.

most flexible/bendable	+++++
	+++
	++
least flexible/bendable	+

[2]

- (v) Describe and explain the changes in length and flexibility in the potato strip that had been **in solution A**.

.....

.....

.....

.....

.....

.....

.....

.....

..... [4]

- (vi) Identify **two** problems with the method used in this investigation that might have led to unreliable conclusions. Suggest a way in which each could have been improved to make the results more reliable.

problem 1

improvement 1

.....

problem 2

improvement 2

..... [4]

(b) Another student investigated the effect of varying concentrations of sucrose solution on some potato tissue by measuring changes in the **mass** of the tissue.

He placed five pieces of potato tissue, each with a mass of 5 g, in five separate test-tubes.

The test-tubes contained either distilled water or one of four different concentrations of sucrose solution.

Later he poured away the solutions.

(i) State **two** factors, apart from the mass of tissue, that should have been kept constant when using this method.

1

2 [2]

When he removed the pieces of tissue from the test-tubes, he carefully dried them on a paper towel.

(ii) Explain why it was important to dry them.

.....
.....
.....
..... [2]

The table shows the measurements at the end of the investigation.

sucrose concentration / mol per dm ³	mass at end of investigation / g
0.0	5.7
0.2	5.2
0.4	4.6
0.5	4.3
0.8	3.3

- (iii) Construct a line graph of the data in the table on the grid below. Join your points with ruled, straight lines.

[4]

- (iv) Use your graph to determine the concentration of sucrose which will produce no change in mass.

concentration [2]

- (v) Describe the method you used to determine this concentration of sucrose.

.....

 [1]

[Total: 28]

- 2 The photomicrograph shows the central part of a plant root as seen under a light microscope.

- (a) (i) The xylem and phloem are surrounded by a layer of tissue that is one cell thick. The cell labelled **E** is in this layer.

Make a large drawing of cell **E** and the cells that touch it on the outside and inside of the layer.
