Cambridge Ordinary Level

CANDIDATE NAME	

CENTRE NUMBER							CANDIDATE NUMBER				

PHYSICS **5054/42**

Paper 4 Alternative to Practical **May/June 2018**

1 hour

Candidates answer on the Question Paper.

No Additional Materials are required.

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name on all the work you hand in.
Write in dark blue or black pen.
You may use an HB pencil for any diagrams or graphs.
Do not use staples, paper clips, glue or correction fluid.
DO **NOT** WRITE IN ANY BARCODES.

Answer **all** questions.

Electronic calculators may be used.
You may lose marks if you do not show your working or if you do not use appropriate units.

At the end of the examination, fasten all your work securely together.
The number of marks is given in brackets [ ] at the end of each question or part question.

This document consists of **12** printed pages.

[Turn over

1   A student measures the resistance of a lamp when there are different currents in the lamp.

     She sets up the circuit shown in Fig. 1.1.
Fig. 1.1

(a) On Fig. 1.1, draw the symbol for a voltmeter connected to measure the potential difference
    V across the lamp.   [1]

(b) She adjusts the variable resistor until she obtains the readings on the voltmeter scale and
    the ammeter scale shown in Fig. 1.2.
Fig. 1.2

     Read, and record in the table of Fig. 1.3, the potential difference V and the current I.

	V/V	I/A	R/Ω	brightness of lamp
first readings				bright
second readings	0.83	0.11		dim

[2]

Fig. 1.3

(c) The student adjusts the variable resistor and measures the new values of *V* and *I*. Her values are shown in the table of Fig. 1.3. The lamp is dimmer.

Use the equation

$$R = \frac{V}{I}$$

to calculate the resistance *R* of the lamp for both settings of the variable resistor.

Record your answers in the table to an appropriate number of significant figures.

[1]

(d) The student thinks that because the same lamp is used throughout the experiment, its resistance is constant.

State whether the student's results confirm this. Justify your answer by referring to the results.

....

....

....[1]

(e) Another student says that the resistance of a lamp filament increases when it gets hot.

State, giving a reason, whether the observations confirm this.

....

....

....[1]

2   A student investigates the reflection of light by a plane mirror.

   •   She places the mirror vertically on a sheet of paper.
   •   She uses a pencil to mark the position of the plane mirror with a straight line and
       labels the line XY.
   •   She removes the mirror and draws a normal at the centre of the line, and labels the
       normal AC.
   •   She labels the point where the normal crosses the mirror with the letter B.

The sheet of paper is shown in Fig. 2.1.

Fig. 2.1

5054/42/M/J/18

(a) A ray of light is incident on the mirror at B with an angle of incidence of 40°.

On Fig. 2.1, draw a line 10 cm long from B to the left of the normal and below the mirror to represent the incident ray. Label the other end of the line D. [2]

(b) • The student replaces the mirror.
  • She places a pin **P₁** close to point B on the line DB and places a second pin **P₂** at point D.
  • She views the images of **P₁** and **P₂** in the mirror from the direction indicated by the eye E in Fig. 2.1.
  • She places two pins **P₃** and **P₄** on the paper so that **P₃** and **P₄**, and the images of **P₁** and **P₂** when viewed by E, are in a straight line.

The positions of **P₃** and **P₄** are shown in Fig. 2.1.

(i) On Fig. 2.1, draw a line joining the positions of **P₃** and **P₄**. Continue your line until it reaches the mirror. [1]

(ii) Measure the angle of reflection *r*.

r = ... ° [1]

(c) State **one** precaution that the student should take when positioning the pins to obtain an accurate value for *r*.

....

....[1]

3   A student measures the least pressure that a rectangular wooden block exerts on a table.

- He places the wooden block on a sheet of paper, with its largest surface touching the paper.
- He uses a pencil to draw the outline of the wooden block on the paper.

Fig. 3.1 shows the outline of the block drawn on the paper.
wooden block
Fig. 3.1 (view from above)

(a) Take measurements from the block to the nearest 0.1 cm and calculate the area A of its largest surface.

length = ...

width = ...

A = ... cm^2 [2]

5054/42/M/J/18

(b) The student finds the weight W of the block with a newton meter, as shown in Fig. 3.2.

Fig. 3.2

Write down the weight W of the block.

$W =$ .... N [1]

(c) Use the equation

$$p = \frac{W}{A}$$

to calculate the pressure p due to the weight of the block on the table.

$p =$ .... N/cm^2 [1]

(d) Another student says that the actual pressure due to the weight of the block on the table is greater than the value calculated in **(c)**.

Suggest **one** practical reason for this.

....

....[1]

4 A student measures the density of copper using a balancing method.

- She sets up the apparatus as shown in Fig. 4.1.
Fig. 4.1

- She places a pivot under the 60.0 cm mark of the metre rule. The position of the pivot is not changed during the experiment.
- She places a 150 g mass M on the rule so that its centre is at the 90.0 cm mark of the rule, as shown in Fig. 4.1.
- She places a copper cylinder on the rule and adjusts its position until the rule is just balanced.

Fig. 4.2 shows the position of the cylinder at balance.
Fig. 4.2 (view from above)

The distance from the left-hand end of the metre rule to the centre of the base of the cylinder is r_1.

(a) Take readings from Fig. 4.2 to find r_1. Record your value of r_1 in the table of Fig. 4.3.

Show your working.

r_1 = ...[2]

(b) The student repeats the procedure by moving mass M and placing its centre on the 85.0, 80.0, 75.0 and 70.0 cm marks of the metre rule. Her results are shown in the table of Fig. 4.3.

The distance from the left-hand end of the metre rule to the centre of mass M is r_2.

r_1/cm	r_2/cm	distance of centre of the cylinder from pivot $x = (60 - r_1)$/cm	distance of centre of mass M from pivot $y = (r_2 - 60)$/cm
	90.0		
20.2	85.0	37.8	25.0
31.9	80.0	28.1	20.0
41.8	75.0	16.4	15.0
55.3	70.0	4.7	10.0

Fig. 4.3

0
0

Fig. 4.4

5054/42/M/J/18
(i) Record, in the table of Fig. 4.3, the missing values of x and y. [1]

(ii) On the grid in Fig. 4.4, plot a graph of y (y-axis) against x (x-axis). Start your axes from the origin (0,0). Draw the straight line of best fit. [4]

(iii) Determine the gradient of your line.

Show your working and indicate on your graph the values you choose.

gradient of line = ...[2]

(iv) The mass m, in grams, of the copper cylinder is given by the equation

$$m = 150 \times \text{gradient}.$$

Use this equation to calculate m to the nearest gram.

m = ... g [1]

Question 4 is continued on page 12.

(c) The student uses a measuring cylinder to find the volume *V* of the copper cylinder.

- She pours 50 cm³ of water into the measuring cylinder.
- She lowers the copper cylinder gently into the measuring cylinder.

Fig. 4.5 shows the measuring cylinder containing the copper cylinder.

Fig. 4.5

Use the information in Fig. 4.5 to calculate the volume *V* of the copper cylinder.

V = ... cm³ [2]

(d) Calculate the density ρ of copper using your answers to **(b)(iv)** and **(c)** and the equation

$$\rho = \frac{m}{V}.$$

ρ = ... g/cm³ [1]

(e) The value for the density of copper obtained in **(d)** differs slightly from the correct value.

State **one practical** reason for this difference.

....
